$$f(x) = x^4 + 3x - 9$$

Antiderivatives

- Which function $F(x)$ should we differentiate to get

$$f(x) = x^4 + 3x - 9$$

$$F(x) = \frac{1}{5}x^5 + \frac{3}{2}x^2 - 9x$$

$$F(x) = \frac{1}{5}x^5 + \frac{3}{2}x^2 - 9x$$

$$F(x) = \frac{1}{5}x^5 + \frac{3}{2}x^2 - 9x + 10$$

Antiderivatives

- Which function $F(x)$ should we differentiate to get

$$f(x) = x^4 + 3x - 9$$

$$F(x) = \frac{1}{5}x^5 + \frac{3}{2}x^2 - 9x$$

$$F(x) = \frac{1}{5}x^5 + \frac{3}{2}x^2 - 9x + 10$$

$$F(x) = \frac{1}{5}x^5 + \frac{3}{2}x^2 - 9x + C, \quad C \in \mathbb{R}$$

Antiderivatives

Given a function, $f(x)$, an **anti-derivative** of $f(x)$ is any function $F(x)$ such that

$$F'(x) = f(x)$$

If $F(x)$ is any anti-derivative of $f(x)$ then the most general anti-derivative of $f(x)$ is called an **indefinite integral** and denoted,

$$\int f(x) dx = F(x) + c, \quad c \text{ is any constant}$$

In this definition the \int is called the **integral symbol**, $f(x)$ is called the **integrand**, x is called the **integration variable** and the “ c ” is called the **constant of integration**.

Definite Integral

Definite Integral

Definite Integral

Definite Integral

$$\int_a^b f(x)dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i)\Delta x$$

Definite Integral

- The fundamental theorem of Calculus:

$$\int_a^b f(x)dx = F(b) - F(a)$$

- Example:

$$\int_0^1 x^2 dx = \frac{1}{3} x^3 \Big|_0^1 = \frac{1}{3} - 0 = \frac{1}{3}$$

Definite Integral: Properties

1. $\int_a^b f(x) \, dx = - \int_b^a f(x) \, dx$. We can interchange the limits on any definite integral, all that we need to do is tack a minus sign onto the integral when we do.
2. $\int_a^a f(x) \, dx = 0$. If the upper and lower limits are the same then there is no work to do, the integral is zero.
3. $\int_a^b c f(x) \, dx = c \int_a^b f(x) \, dx$, where c is any number. So, as with limits, derivatives, and indefinite integrals we can factor out a constant.
4. $\int_a^b f(x) \pm g(x) \, dx = \int_a^b f(x) \, dx \pm \int_a^b g(x) \, dx$. We can break up definite integrals across a sum or difference.
5. $\int_a^b f(x) \, dx = \int_a^c f(x) \, dx + \int_c^b f(x) \, dx$ where c is any number. This property is more important than we might realize at first. One of the main uses of this property is to tell us how we can integrate a function over the adjacent intervals, $[a, c]$ and $[c, b]$. Note however that c doesn't need to be between a and b .

Definite Integral – Example 2

$$\int_0^1 2e^{-2x} dx =$$

Definite Integral – Example 2

$$\int_0^1 2e^{-2x} dx = -e^{-2x} \Big|_0^1 =$$

Definite Integral – Example 2

$$\int_0^1 2e^{-2x} dx = -e^{-2x} \Big|_0^1 = -e^{-2} + 1 = 1 - \frac{1}{e^2}$$

Definite Integral – Example 3

$$\int_{-1}^1 \frac{1}{x^2} dx =$$

Definite Integral – Example 3

$$\int_{-1}^1 \frac{1}{x^2} dx =$$

$\frac{1}{x^2}$ isn't defined at 0
Not a definite integral!
