Indefinite integrals

$$\int f(x)dx$$

• Definite integrals

$$\int_{a}^{b} f(x) dx$$

• Improper integrals

$$\int_{-\infty}^{+\infty} f(x) dx$$

# Indefinite Integral

#### **Antiderivatives**

• Which function F(x) should we differentiate to get

$$f(x) = x^4 + 3x - 9$$

#### **Antiderivatives**

• Which function F(x) should we differentiate to get

$$f(x) = x^4 + 3x - 9$$

$$F(x) = \frac{1}{5}x^5 + \frac{3}{2}x^2 - 9x + C, \qquad C \in \mathbb{R}$$

#### **Antiderivatives**

Given a function, f(x), an **anti-derivative** of f(x) is any function F(x) such that

$$F'(x) = f(x)$$

If F(x) is any anti-derivative of f(x) then the most general anti-derivative of f(x) is called an **indefinite integral** and denoted,

$$\int f\left( x
ight) \,dx=F\left( x
ight) +c,\qquad c ext{ is any constant}$$

In this definition the  $\int$  is called the **integral symbol**, f(x) is called the **integrand**, x is called the **integration** variable and the "c" is called the **constant of integration**.

$$\int_{a}^{b} f(x)dx = \lim_{n \to \infty} \sum_{i=1}^{n} f(x_i) \Delta x$$

The fundamental theorem of Calculus:

$$\int_{a}^{b} f(x)dx = F(b) - F(a)$$

Example:

$$\int_0^1 x^2 dx = \frac{1}{3} x^3 \Big|_0^1 = \frac{1}{3} - 0 = \frac{1}{3}$$

# **Definite Integral: Properties**

1. 
$$\int_a^b f(x) dx = -\int_b^a f(x) dx$$
. We can interchange the limits on any definite integral, all that we need to do is tack a minus sign onto the integral when we do.

2. 
$$\int_{a}^{a} f(x) dx = 0$$
. If the upper and lower limits are the same then there is no work to do, the integral is zero.

3. 
$$\int_a^b cf(x) \ dx = c \int_a^b f(x) \ dx$$
, where  $c$  is any number. So, as with limits, derivatives, and indefinite integrals we can factor out a constant.

4. 
$$\int_a^b f(x) \pm g(x) \ dx = \int_a^b f(x) \ dx \pm \int_a^b g(x) \ dx$$
. We can break up definite integrals across a sum or difference.

5. 
$$\int_a^b f(x) \ dx = \int_a^c f(x) \ dx + \int_c^b f(x) \ dx$$
 where  $c$  is any number. This property is more important than we might realize at first. One of the main uses of this property is to tell us how we can integrate a function over the adjacent intervals,  $[a,c]$  and  $[c,b]$ . Note however that  $c$  doesn't need to be between  $a$  and  $b$ .

# **Definite Integral – Example 2**

$$\int_0^1 2e^{-2x} dx = -e^{-2x} \Big|_0^1 = -e^{-2} + 1 = 1 - \frac{1}{e^2}$$
